

DIALED IN

THE DEEP FOCUS PROTOCOL

Unshakeable attention — without the jitters,
the crash, or the 3pm slump.

A practical guide from **Dialed In**

Why your focus keeps breaking

You aren't losing focus because you're lazy. You're losing it because modern life is engineered to steal it. Notifications, feeds, and a dopamine loop that resets every 90 seconds — all of it is designed to keep you scattered. Deep work is the one skill that compounds into money, output, and leverage, and it's the one skill the environment is actively working against.

Attention runs on three things you can actually control:

1. **Chemistry** — the raw materials your brain uses to lock in.
2. **Timing** — when you dose and when you do the hard work.
3. **Environment** — removing the triggers that pull you out.

This protocol fixes all three. It's not another 47-step morning routine — it's a stack, a schedule, and a set of rules you can run every day.

The stack

Every ingredient below earns its place. No filler, no pixie dust. Each one supports a specific part of the focus system — energy, clarity, calm, or recovery.

Lion's Mane	Nerve growth factor — builds the neural infrastructure for clearer thinking and memory.
Cordyceps	Raises ATP (cellular energy) so output stays steady without a stimulant spike.
Caffeine + L-Theanine	100mg caffeine + 200mg L-theanine — the classic no-jitter combo. Clean energy, calm focus.
Alpha-GPC	A choline source — fuels acetylcholine, the neurotransmitter behind memory and drive.
Vitamin D3 + K2	D3 for mood and cognition; K2 to direct calcium where it belongs.
Zinc + Magnesium	Neurotransmitter function, calm, and recovery. Most people are deficient.
Ashwagandha	Lowers cortisol — keeps stress from hijacking your attention mid-task.

The daily protocol

1. Light before screen

Get 5–10 minutes of daylight before your phone. It sets your circadian clock and sharpens morning alertness.

2. Hydrate, then stack

A glass of water, then your dose — with or after food to avoid any stomach sensitivity from the caffeine.

3. One deep-work block

90 minutes, one task, phone in another room. This is where the stack does its best work.

4. Move mid-morning

10 minutes of walking or mobility. Movement clears adenosine and re-ups focus for the afternoon.

5. Cut caffeine by 2pm

Keep the second half of the day clean so sleep quality doesn't get taxed.

6. Wind down with magnesium

Magnesium + ashwagandha in the evening supports calm and recovery — the foundation of tomorrow's focus.

The multipliers

The stack gets you 70% of the way. These four things decide the other 30%:

- **Sleep** — 7–8 hours, same window. Everything else is borrowed against it.
- **Sunlight** — morning light for alertness, dim light at night for recovery.
- **Exercise** — even 20 minutes of movement is a cognitive upgrade.
- **Hydration** — 2% dehydration measurably hurts attention. Water first, caffeine second.

Focus is a system, not a pill. Run the protocol for two weeks and the difference is hard to miss — deeper work, fewer crashes, more done by noon.

Ready to run it?

Dialed In — Focus puts this entire stack in one daily dose.
